ö
This sequence represents a human sel-10 protein of the invention. This sequence is specifically a human mammary sel-10 protein. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (PS-1) or PS-2, and therefore may be useful for the prevention or treatment of Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 540

                                                                                                                                                                                                                            The present invention relates to human sel-10. The sel-10 proteins of the invention are useful for raising monoclonal or polyclonal antibodies useful in diagnostic assays for detecting sel-10 polypeptide expression. The sel-10 polypeptides are also useful as drug targets for decreasing antibody levels in the treatment of Alzheimer's disease. It is also useful for identifying agents capable of altering the production level of Abeta. The polynucleotides are useful for develophing assays for identifying agents capable of interfering with the blological pathways that lead to Alzheimer's disease.
                                                                                                                                      New human sel-10 polypeptides and their encoding polynucleotides, useful for raising antibodies for detecting sel-10 polypeptide expression and as drug targets in the treatment of Alzheimer's disease

This sequence represents a human sel-10 protein of the invention. This sequence is specifically a human mammary sel-10 protein. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (PS-1) or PS-2, and therefore may be useful for the prevention or treatment of Alzheimer's

and treating various diseases such as
immune deficiency syndrome (AIDS),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           associated proteins (GPRAP). The present sequence is human GTPAP-29 protein. This sequence was derived from a cDNA library of brain tumour tissue. This protein is expressed in nervous, reproductive and gastrointestinal Lissue. The GTPAP proteins may be used to define agonists and antagonists of GTPAP proteins may be useful for treatment or GTPAP. This means the GTPAP proteins may be useful for treatment or prevention of diseases associated with GTPAP such as cell proliferation disorders, autoimmune disorders, inflammatory disorders, immune system disorders, cancer, ALDS, asthma, atherosclerosis, arthritis, systemic lupus erythematosus and psoriasis.

The present invention relates to human sel-10. The sel-10 proteins of the invention are useful for raising monoclonal or polyclonal antibodies useful in diagnostic assays for detecting sel-10 polypeptide expression. The sel-10 polypeptides are also useful as drug targets for decreasing antibody levels in the treatment of Alzheimer's disease. It is also useful for identifying agents capable of altering the production level of Abeta. The polynucleotides are useful for developing assays for identifying agents capable of interfering with the biological pathways that lead to Alzheimer's disease.
                                                                            their encoding polynucleotides, detecting sel-10 polypeptide the treatment of Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      YDGRRVVSGAYDFWVKVWDPETETCLHTLQGHTNRVYSLQFDGIHVVSGSLDTSIRVWDV 450

The present invention relates to human sel-10. The sel-10 proteins of the invention are useful for raising monoclonal or polyclonal antibodies useful in diagnostic assays for detecting sel-10 polypeptide expression. The sel-10 polypeptides are also useful as drug targets for decreasing antibody levels in the treatment of Alzheimer's disease. It is also useful for identifying agents capable of altering the production level of Abeta. The polynucleotides are useful for developing assays for identifying agents capable of interfering with the biological pathways that lead to Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                their encoding polynucleotides,

This sequence is specifically a human hippocampal sel-10 protein. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (PS-1) or PS-2, and therefore may be useful for the prevention or treatment of

                           This sequence is an epitope-tagged version of a human sel-10 protein of the invention. The human sel-10 proteins of the invention are isolated from hippocampus and mammary gland. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (PS-1) or PS-2, and therefore may be useful for the prevention or treatment of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                216
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              276
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              336

                                                                                                                                                                                                                                                                                                                                                                                                            ٠,
                                                                                                                                                                                    New human sel-10 polypeptides and their encoding polynucleotides, useful for raising antibodies for detecting sel-10 polypeptide expression and as drug targets in the treatment of Alzheimer's disease
                                                                                                                                                                                                                                                                the invention are useful for raising monoclonal or polyclonal antibodies useful in diagnostic assays for detecting sel-10 polypeptide expression. The sel-10 polypeptides are also useful as drug targets for decreasing antibody levels in the treatment of Alzheimer's disease. It is also useful for identifying agents capable of altering the production level of Abeta. The polynucleotides are useful for developing assays for identifying agents capable of interfering with the biological pathways that lead to Alzheimer's disease.
                                                                                                                                                                                                                                                        The present invention relates to human sel-10. The sel-10 proteins of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              156

This sequence is an epitope-tagged version of a human sel-10 protein of the invention. The human sel-10 proteins of the invention are isolated from hippocampus and mammary gland. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (FS-1) or PS-2, and therefore may be useful for the prevention or treatment of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sel-10; human; presentlin; Alzheimer's disease; PS-1; PS-2; hippocampus;

the invention are useful for raising monoclonal or polyclonal antibodies useful in diagnostic assays for detecting selling polypeptide expression. The sello polypeptides are also useful as drutargets for decreasing antibody levels in the treatment of Alzheimer's disease. It is also useful for identifying agents capable of altering the production level of Abete. The polynucleotides are useful for developing assays for identifying agents capable of interfering with the biological pathways that lead to Alzheimer's disease.

                                                                                                                                                                                                                                                                        2
                                                                                                                                                                   This sequence represents a human sel-10 protein of the invention. This sequence is specifically a human hippocampal sel-10 protein. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (PS-1) or PS-2, and therefore may be useful for the prevention or treatment of
                                                                                                                                                                                                                                                                                                                      121

The present invention relates to human sel-10. The sel-10 proteins of the invention are useful for raising monoclonal or polyclonal antibodies useful in diagnostic assays for detecting sel-10 polypeptide expression. The sel-10 polypeptides are also useful as drug targets for decreasing antibody levels in the treatment of Alzheimer's disease. It is also useful for identifying agents capable of altering the production level of Abeta. The polynucleotides are useful for developing assays for identifying agents capable of interfering with the biological pathways that lead to Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human sel-10 polypeptides and their encoding polynucleotides, useful for raising antibodies for detecting sel-10 polypeptide expression and as drug targets in the treatment of Alzheimer's disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a human sel-10 protein of the invention. This sequence is specifically a human hippocampal sel-10 protein. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (PS-1) or PS-2, and therefore may be useful for the prevention or treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      human; presentiin; Alzheimer's disease; PS-1; PS-2; hippocampus;

The present invention relates to human sel-10. The sel-10 proteins of antibodies useful for raising monoclonal or polyclonal antibodies useful in diagnostic assays for detecting sel-10 polypeptide expression. The sel-10 polypeptides are also useful as drug targets for decreasing antibody levels in the treatment of Alzheimer's alsease. It is also useful for identifying agents capable of altering the production level of Abeta. The polynucleotides are useful for developing assays for identifying agents capable of interfering with the biological pathways that lead to Alzheimer's disease.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                        September 25, 2001, 14:39:00; Search time 13.65 Seconds

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

B48088

beta-transducin repeat-containing protein - African clawed frog
N;Alternate names: beta-Trcp
C;Species: Xenopus laevis (African clawed frog)
C;Date: 26-May-1994 #sequence_revision 26-May-1994 #text_change 21-Jul-2000
C;Accession: B48088
R;Spevak, W.; Keiper, B.D.; Stratowa, C.; Castanon, M.J.
Mol. Call. B40.1 13, 4953-4966, 1993
A;Title: Saccharomyces corevisiae cdc15 mutants arrested at a late stage in anaphase are A;Reference number: A48088; MUID:93330289
A;Title: Saccharomyces corevisiae cdc15 mutants arrested at a late stage in anaphase are A;Reference number: A48088; MUID:93330289
A;Status: prelliminary
A;Molecule type: mRNA
A;Residues: 1-518 45PE>
A;Cross-references: GB:M98268; NID:9295542; PIDN:AAA02810.1; PID:9295543
C;Superfamily: unassigned WD repeat proteins; WD repeat homology
C;Keywords: duplication
F;431-462/Domain: WD repeat homology <WDI>

T46032
WD-40 transport regulatory protein tupl homolog - Arabidopsis thaliana
N;Alternate names: protein T16K5.10
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 04-Feb-2000 #sequence_revision 04-Feb-2000 #text_change 26-May-2000
C;Accession: T46032
R;Rieger, M.; Gabel, C.; Mueller-Auer, S.; Schaefer, M.; Zipp, M.; Mewes, H.W.; Lemcke, submitted to the Protein Sequence Database, January 2000
A;Reference number: 223015
A;Accession: T46032
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-317 CRIE>
A;Cross-references: EMBL:AL132965
A;Experimental source: cultivar Columbia; BAC clone T16K5
C;Genetics:
A;Map position: 3
A;Introns: 222/3
A;Note: T16K5.10
C;Superfamily: unassigned WD repeat proteins; WD repeat homology
                                                                                                                                                                                                                                                                                                                     7;

THE PROTEIN IS ESSENTIAL FOR INITIATION OF DNA

REPLICATION: THIS PROTEIN IS ESSENTIAL FOR INITIATION OF DNA

REPLICATION AND SEPRATION OF THE SINDLE BOLIES TO FORM OF THE MITOTIC SPINDLE. IT ALSO PLAYS A ROLE IN BUD

DEVELOPMENT, FUSION OF ZYGOTIC NUCLEI AFTER CONJUGATION AND

VARIOUS ASPECTS OF SPORULATION. REQUIRED FOR HTAI-HTBI LOCUS

TRANSCRIPTION ACTIVATION (BY SIMILARITY).

SIMILARITY: CONTAINS 1 F-BOX DOMAIN.

SIMILARITY: CONTAINS 7 WD REPEATS (TRP-ASP DOMAINS).
